Abstract

The Self-Organizing Map (SOM) algorithm has attracted an ever increasing amount of interest among researches and practitioners in a wide variety of fields. The SOM and a variant of it, the LVQ, have been analyzed extensively, a number of variants of them have been developed and, perhaps most notably, they have been applied extensively within fields ranging from engineering sciences to medicine, biology, and economics. We have collected a comprehensive list of 3343 scientific papers that use the algorithms, have benefited from them, or contain analyses of them. The list is intended to serve as a source for literature surveys. We have provided both a thematic and a keyword index to help finding articles of interest.

1 INTRODUCTION

The Self-Organizing Map algorithm [1530, 1537, 1593] was introduced in 1981. The earliest applications were mainly in engineering tasks. Later the algorithm has become progressively more accepted as a standard data analysis method in a wide variety of fields that can utilize unsupervised learning: clustering, visualization, data organization, characterization, and exploration. The variant called Learning Vector Quantization (LVQ) has additionally been used extensively in supervised tasks, especially classification and supervised pattern recognition.

Many of the papers on SOM analyze the method or present variants or generalizations of it. Most of the papers, however, apply the method or its variants in fields ranging from engineering (including image and signal processing and recognition, telecommunications, process monitoring and control, and robotics) and natural sciences to medicine, humanities, economics and mathematics. The definitive reference to the state of the art in SOMs is [1593].

1.1 Collection Method

We have been collecting a bibliography of scientific papers on SOM already for many years. Our criterion in selecting papers has been that they should either use or analyze the SOM, or benefit from it in some other manner. Our intention has been to exclude papers that merely refer to the algorithm.

Several methods have been used in collecting the bibliography. We have added references to papers that have appeared in the journals and conference proceedings that we personally follow. In addition, several authors have kindly helped us by sending us bibliographies on their own papers. Finally, we have made searches in commonly used bibliographic databases.

We intend to maintain the bibliography in the future. New entries will be included as attachments in this paper. Additionally, the entries will be available in BibTeX format at the WWW address

1.2 Advice on Using the Bibliography

We have constructed indices to aid in exploring the vast bibliography. Unfortunately it would have been infeasible to compile manually a complete index of the whole collection of papers, and we have therefore constructed two different kinds of indices.

The first index is thematically organized, and it contains references to manually selected papers. Therefore, all of the papers that have been listed will probably be useful, but all the possibly relevant papers will not occur in the index. Some hints of index terms that might lead to additional papers have been provided.

We have also constructed a keyword index. The papers were chosen mostly automatically based on the words that appear in their titles, and therefore the index cannot be as well-organized as a manually generated one. For example, all of the papers that treat speech recognition cannot be found using the index entry "speech". On the other hand, some index terms may contain references to several kinds of papers. For example, it may be clear that all of the papers that contain the word "growing" do not analyze growing SOMs. We recommend using several keywords and to utilize the thematic index in finding suitable keywords.

Despite the problems mentioned above we felt that it was important to make every possible clue of useful information available; it would be a totally infeasible task to browse through the complete list of 3343 papers when searching for papers on a specific topic. In fact, almost all (2916 out of 3343) of the papers have been referred to in either of the indices. We hope that the combination of the thematic index, the keyword index, and keyword searches in the Web version of this paper will aid in the difficult task of finding useful information among the large collection of SOM papers.
